Adept Code - Tournament App AI Prompts

Introduction

This ebook provides the exact AI prompts used to create a Tournament App using mobile and AI, as demonstrated on the Adept Code YouTube channel. You can copy these prompts and use them with your preferred AI tool to build your own app.

Remember to only use the official links provided below to avoid fake accounts and groups.

Main Prompt: Tournament App Generation

```
You are an expert full-stack developer. Your task is to generate a fully working mobile-first Tournament Web App called **"Adept Play"**, using ONLY the following technologies:
✅ HTML
✅ Tailwind CSS
✅ JavaScript (for basic UI/UX only, NO AJAX)
✅ PHP
✅ MySQL DB
✅ Font Awesome (only for icons)

NO external frameworks like React, Vue, Laravel, Bootstrap, jQuery, or AJAX should be used. All actions should be handled through traditional PHP form submissions and page reloads.
The design should resemble a real mobile application — user-friendly, responsive, and clean UI. All text selection, right-click, and zoom in/out must be disabled using JavaScript.

---

## ✅ APP STRUCTURE OVERVIEW:

📁 Root Folder
├ 📁 common
│ ├ header.php
│ ├ bottom.php
│ └ config.php
├ 📁 admin
│ ├ login.php
│ ├ index.php
│ ├ tournament.php
│ ├ manage_tournament.php
│ ├ user.php
│ ├ setting.php
│ └ 📁 common
│   ├ header.php
│   └ bottom.php
├ login.php
├ index.php
├ my_tournaments.php
├ wallet.php
├ profile.php
├ install.php
└ .htaccess (optional)

---

## ✅ COMMON INCLUSIONS (User & Admin Panel)

*   `config.php` – one centralized DB connection (host: 127.0.0.1, user: root, pass: root)
*   `header.php` – contains the top navigation, logo, and user\"s wallet balance.
*   `bottom.php` – fixed bottom navigation with icons (Home, My Tournaments, Wallet, Profile).

All UI components must use Tailwind classes only, and Font Awesome for icons. Use a modern dark theme.
```

```
---

## 👩‍💻 USER PANEL – Pages Design & Functionality

### 1. login.php
*   Design: Two tabs – Login and Sign Up in the same file.
*   Fields: Username, Password | Username, Email, Password (for signup).
*   Use standard PHP form submission. Show errors/success messages on the same page after reload.
*   On success, redirect to `index.php`.

---

### 2. index.php (Homepage)
*   Display a list of all \"Upcoming\" tournaments in a card grid format.
*   Card: Tournament Title, Game Name, Match Time, Entry Fee, Prize Pool.
*   Each card must have a \"Join Now\" button inside a `<form>` tag.
*   Clicking \"Join Now\" should submit the form to the same page (`index.php`). The PHP logic at the top of the file will handle the joining process: check balance, deduct fee, and add user to participants. Show a success/error message after the page reloads.

---

### 3. my_tournaments.php
*   Use a two-tab layout:
    *   **\"Upcoming/Live\" tab:** Shows tournaments the user has joined that are not yet completed. If a tournament is live, it should display the **Room ID** and **Password**.
    *   **\"Completed\" tab:** Shows a history of all tournaments the user has played, along with their results (e.g., \"Winner\", \"Participated\").

---

### 4. wallet.php
*   Display current wallet balance in a large, prominent card.
*   Show a transaction history list.
*   Include \"Add Money\" and \"Withdraw\" buttons (dummy buttons).

---

### 5. profile.php
*   Show and Edit: Username, Email.
*   Change password section.
*   Logout button.

---

## ⚙ ADMIN PANEL – Pages Design & Functions

### 1. login.php
*   Simple, secure login page for the admin using a standard PHP form.
*   Fields: Username & Password.

---

### 2. index.php (Admin Dashboard)
*   Mobile-app style Admin Dashboard with clean, modern UI.
*   Show quick stats using small Tailwind grid cards:
    *   Total Users, Total Tournaments, Total Prize Distributed, Total Revenue (Commission).
```

```
*   Include a quick-action button: \"Create New Tournament\".

---

### 3. tournament.php
*   A standard PHP form to add a new tournament.
*   Fields: Title, Game Name, Entry Fee, Prize Pool, Match Time, Commission
Percentage (e.g., 20%).
*   On submission, the page reloads and shows a success/error message.
*   Below the form, show a list of all created tournaments with options to
Edit/Delete (leading to other pages or handled with GET/POST requests).

---

### 4. manage_tournament.php
*   This is the core management page for a single tournament.
*   Display a list of all users who have joined.
*   A form to enter/update the **Room ID** and **Room Password**.
*   A form with a dropdown menu of all participants to select the winner.
*   A button \"Declare Winner & Distribute Prize\". When the form is submitted,
the PHP logic will:
    1.  Add the `prize_pool` amount to the winner\"s wallet.
    2.  Change the tournament `status` to \\\\\\\'Completed\\\\\\\
    3.  Show a success message after the page reloads.

---

### 5. user.php
*   List all registered users with their current wallet balance.
*   Option to view a user\"s match history or block the user.

---

### 6. setting.php
*   Update admin info/password using a standard PHP form.

---

## 🛠️ FEATURES TO IMPLEMENT:

*   All actions are handled by traditional PHP form submissions (POST/GET).
*   `install.php` must:
    *   Create the database and all required tables.
    *   Insert default admin credentials (admin/admin123).
    *   Redirect to `login.php` after successful installation.

---

## 📦 DATABASE SCHEMA (Install File Should Auto-Create)

*   `users` (id, username, email, password, wallet_balance, created_at)
*   `admin` (id, username, password)
*   `tournaments` (id, title, game_name, entry_fee, prize_pool, match_time,
room_id, room_password, status, created_at)
*   `participants` (id, user_id, tournament_id)
*   `transactions` (id, user_id, amount, type, description, created_at)  *
(type: \\\\\\\'credit\\\\\\\' or \\\\\\\'debit\\\\\\\

---

## 🔐 SECURITY & USER EXPERIENCE
```

```
*   Disable right-click, text selection, and zoom using JS.
*   Use `overflow-hidden`, `select-none`, and custom JS for a native app feel.
*   Validate all forms on the server-side (PHP).
*   Use PHP sessions for login tracking.
*   Use prepared statements in PHP to prevent SQL injection.
*   Clean redirects on login/logout.
*   Consistent dark theme, color scheme, and typography across the app.

---

(All pricing/wallet values should be displayed in Indian Rupees (₹) format.
Your output should be a complete ready-to-run project, structured into pages
and folders.)

## 🎁 FINAL DELIVERABLE:

*   Generate all required code files and folders as described above. For each
file, clearly mention:
    *   The filename
    *   The folder/directory where it should be saved
    *   The complete source code/content of the file
*   All PHP files with integrated logic.
*   The complete SQL schema inside `install.php`.
*   The project should be a single folder, ready to be uploaded and run on a
localhost or hosting server.
```

\pagebreak

Follow-up Prompt 1: UPI Deposit and Withdrawal

System

```
 I\"ve uploaded a screenshot of the wallet page from the \"Adept Play\" app you helped create. The \"Add Money\" and \"Withdraw\" buttons are currently not functional.

Your task is to implement a complete, secure, and user-friendly manual UPI deposit and withdrawal system. Please follow these detailed instructions for the logic, UI, and database updates.

---

## ✅ 1. CORE FEATURE IMPLEMENTATION:

### **A. Deposit (Add Money) System:**

*   **Admin Side (New Feature):**
    *   In the Admin Panel, create a new settings page or add to the existing one.
    *   This section must allow the admin to **upload a QR code image** and **set their UPI ID**. This information should be saved in the database (e.g., in a new `settings` table).

*   **User Side (Wallet Page):**
    *   When a user clicks the \"Add Money\" button, it should open a **modal/popup**.
    *   This modal must display the Admin\"s QR code image and their UPI ID (fetched from the database).
    *   Below the QR code, provide a simple form for the user to submit a deposit request. The form should have two fields:
        1.  **Amount Paid (₹):** The amount the user has manually sent.
        2.  **UPI Transaction ID:** The unique transaction ID from their payment app (e.g., PhonePe, GPay). This is crucial for verification.

*   **Backend Logic (Deposit Request):**
    *   When the user submits this form, it must create a new \"deposit request\" with a \\\\\\\'Pending\\\\\\\' status in a new `deposits` table.
    *   The Admin Panel needs a new page called **\"Deposit Requests\"** to display all pending requests. Each request should show the username, amount, and the transaction ID provided by the user.
    *   The admin will manually verify the payment in their own bank/UPI app using the transaction ID.
    *   The admin will have two actions for each request: **\"Approve\"** or **\"Reject\"**.
        *   On **Approve:** The requested amount is added to the user\"s `wallet_balance`, a corresponding entry is made in the `transactions` table, and the deposit request status is marked \\\\\\\'Completed\\\\\\\
        *   On **Reject:** The request status is marked \\\\\\\'Rejected\\\\\\\\

### **B. Withdrawal System:**

*   **User Profile (Enhancement):**
    *   In the user\"s `profile.php` page, add a new field for them to **save their own UPI ID**. This should be saved in the `users` table so they don\"t have to enter it every time.

*   **User Side (Wallet Page):**
    *   When a user clicks the \"Withdraw\" button, a modal should appear with a form to request a withdrawal.
```

```
    *   The form should have one field: **Amount to Withdraw (₹)**. Their saved
UPI ID should be displayed for confirmation.

*   **Backend Logic (Withdrawal Request):
    *   Submitting this form creates a \"withdrawal request\" with a
\\\\\\\'Pending\\\\\\\' status in a new `withdrawals` table.
    *   The Admin Panel needs another new page called **\"Withdrawal
Requests\"**.
    *   The admin sees the request (username, amount, user\"s UPI ID), manually
sends the money from their own account, and then marks the request as
**\"Completed\"** in the system. This will create a \\\\\\\'debit\\\\\\\' entry
in the user\"s `transactions` table.

---

## 🛑 2. IMPORTANT: SAFE DATABASE UPDATE INSTRUCTIONS

The new features require changes to the database. It is critical **NOT to
modify or re-run the original `install.php` file**, as this would erase all
existing data.

Instead, please create a **NEW, SEPARATE** PHP file named
`update_database.php`.

The sole purpose of this script is to **safely update the existing database
schema** for users who already have the app installed. This script must perform
the following actions:

1.  **Connect to the database** by including the existing `config.php`.
2.  **Use `CREATE TABLE IF NOT EXISTS`** to create the following new tables:
    *   `deposits` (id, user_id, amount, transaction_id, status
ENUM(\\\\\\\\'Pending\\\\\\\\\
    *   `withdrawals` (id, user_id, amount, status
ENUM(\\\\\\\\'Pending\\\\\\\\\
3.  **Use `ALTER TABLE` to add a new column** to the `users` table, but only if
it doesn\"t already exist. The query should be: `ALTER TABLE users ADD COLUMN
upi_id VARCHAR(255) NULL;` (Check for the column\"s existence before running).
4.  After executing the queries, the script must display a clear, user-friendly
message on the screen, such as: **\"✅ Database schema updated successfully!
You can now safely delete this file.\"**

This approach ensures a safe and professional database migration.

---

## ✅ 3. FINAL DELIVERABLE:

Please provide the complete, updated code for all modified files (like
`wallet.php`, `profile.php`, new admin pages) and the full code for the new
`update_database.php` script.

follow up2-

The app is showing this error because the Admin UPI details are not set.

You forgot to create the settings page in the Admin Panel.

Please create a new page `admin/settings.php`. This page needs a form where I
can:
1.  Enter my UPI ID.
```

```
2.  Upload a QR code image.

Save these two values to the database so the user-side wallet can fetch them.
Also, provide the SQL for any new table needed.
```
